CSP–IMT
Online Workshop 2026

Solar Still technology for sustainable water production

Dr. Tawfiq Chekifi

Applied Renewable Energy Research Unit (URAER), Renewable Energy Development (CDER)

Center t.chekifi@cder.dz chekifi.tawfiq@gmail.com

Introduction

(URAER-CDER), **Ghardaia** City, Algeria

Renewable Energies Development Center (CDER)

The Applied Research Unit in Renewable Energies (URAER) is a **public institution**, the application of RE in **Ghardaia** region **600 Km** from the capital (<https://uraer.cder.dz/>)

Applied Research Unit for Renewable Energies (UAER) **Ghardaia** city

Two divisions

Application of Renewable Energies in Arid and Semi-Arid Environments

Hydrogen
Technology

Solar pumping

Energy Systems for
Agriculture

Building and
Bioclimatic

Mini Solar Power Stations MSPS

Electrical Control

Mini Photovoltaic
Plants

Mini Thermodynamic
Centrals

Hybrid Energetics
Systems

Previous project: **Small solar tower collector**

- Realized and currently in test: produce electricity using steam turbine
- Prototype for graduation and postgraduation student
- 17 heliostats (1 m²) and will be extended in future

After the completion of 17 heliostats of the construction (2021)

Current projects

Solar water heating system

Solar Still system

Photovoltaic thermal hybrid solar collector

Events in CDER, URAER, UDES, URERMS

- Conferences
- Day of studies
- Open days
- Workshops
- Many others activities

Paper Submission		Sponsors		Speakers																	
Authors are requested to submit an extended abstract not exceeding two (2) pages in English. The extended abstract must include the title, author(s), affiliation, main results, and discussion with references. https://easychair.org/conferences/2conf=icreato21 QR Code All the submitted conference papers will be peer-reviewed by the program technical committees of the Conference. All accepted papers of the conference will be published in the printed conference proceedings with a valid International ISBN number.																					
Important Dates <table border="1"> <tr> <td>Submission Deadline</td> <td>30 March 2021</td> </tr> <tr> <td>Acceptance Notification</td> <td>30 April 2021</td> </tr> <tr> <td>Camera ready Paper</td> <td>30 Mai 2021</td> </tr> </table>		Submission Deadline	30 March 2021	Acceptance Notification	30 April 2021	Camera ready Paper	30 Mai 2021	Organization Committee <table border="1"> <tr> <td>Tizaoui Mouloud</td> <td>Foulanine Merlana</td> </tr> <tr> <td>Khelafi Mostefa</td> <td>Babahadi Abdeljabar</td> </tr> <tr> <td>Hadri Kamel</td> <td>Salem Fethya</td> </tr> <tr> <td>Meguelati Farouk</td> <td>Moulay Mohammed</td> </tr> <tr> <td>Tigani Cherif</td> <td>Rouabhia Abdelkrim</td> </tr> </table>		Tizaoui Mouloud	Foulanine Merlana	Khelafi Mostefa	Babahadi Abdeljabar	Hadri Kamel	Salem Fethya	Meguelati Farouk	Moulay Mohammed	Tigani Cherif	Rouabhia Abdelkrim	contact@icreato.net +213049362247 +213049362249 B.P. 478, Route de Reggane, ADRAR	
Submission Deadline	30 March 2021																				
Acceptance Notification	30 April 2021																				
Camera ready Paper	30 Mai 2021

Solar still: working principles

1. Heating (Evaporation)

Sunlight heats the salty or dirty water.
The water changes into water vapor.
Salt and impurities remain in the basin.

2. Cooling (Condensation)

The water vapor touches the cool glass cover.
It changes back into clean water droplets.

3. Freshwater Collection

The droplets slide down the sloped glass.
Clean distilled water is collected in a separate channel.
The remaining salts and contaminants stay in the basin.

Two categories: Passive and Active Solar still

Passive Solar still

In passive SS: Water is purified through **natural processes**: heating, evaporation and condensation

without mechanical parts or external energy

Some Real Passive Solar stills

Rotating hollow drum
inside the solar still

Spherical SS

SS + Reflectors

Conical SS

In general, passive solar stills rely only on sunlight and simple materials to evaporate and condense water. Researchers have experimented with many shapes; rectangular, spherical, stepped, and conical, each designed to capture more sunlight, increase evaporation, or provide larger surfaces for condensation. Some designs also **add reflectors** or **internal components** to boost performance

Active Solar still

In active solar stills, **extra power** or **parts** help them work better. They might use **pumps**, fans, or heaters, which make them more effective but a little harder to manage. These are great for places that need more clean water.

Real Active Solar stills

Solar still + PV

Hybrid SS
(PTC+ETC)

SS+ glass cooling
and water heater

SS+ PTC

SS Performance enhancement

Large-scale solar still desalination

Puerto Chale community plant

- 6 channels, each $1.6 \text{ m} \times 40 \text{ m}$.
- 1000 L/day, serving ~100 people.
- Serving ~80 people.

Puerto Chale community plant

- Area: 54 m^2 , length 38.75 m
- Summer output: 200 L/day ($\sim 3.7 \text{ L/m}^2$)
- 200 L/day

Advantages of Solar Stills

- ✓ **Low cost** technology with simple design, inexpensive materials.
- ✓ Environmentally friendly (**no fossil fuels**).
- ✓ **Easy operation**: minimal maintenance, no skilled labor required.
- ✓ **Scalable**: from household units to community plants.
- ✓ Safe water supply: distilled water free of salts and contaminants.
- ✓ Suitable for **Remote Regions**

Case study: Pyramid solar still

This slide shows pyramid solar stills tested with sand and Paraffine wax PCM.

. Sand provides simple sensible heat storage, while PCM stores latent heat around basin temperatures, extending distillation after sunset. The comparison highlights how material choice directly affects thermal performance and water yield

Property	Value	Relevance for PSS
Density (kg/m ³)	1600	Provides bulk mass for sensible heat storage.
Specific Heat Capacity (J/kg·K)	830	Stores and releases heat gradually.
Thermal Conductivity (W/m·K)	0.27	Enhances heat transfer to basin water.
Water Absorption (%)	0.5	Low absorption ensures stability in saline conditions.
Chemical Composition (major)	92.5% SiO ₂ (Quartz)	Chemically inert and durable for repeated cycles.

Sand

Property	Value	Relevance for PSS
Onset temperature	57.3 °C	Beginning of melting, when PCM starts absorbing solar heat.
Peak temperature	62.1 °C	Maximum melting point, aligns with typical basin water temperatures in PSS.
Offset temperature	64.1 °C	End of melting, defines the full latent heat storage range.
Density	890 kg/m ³	Solid phase at 25 °C.
Thermal Conductivity	0.24 W/m·K	Solid phase at 25 °C.
Latent heat of fusion (ΔH)	175.8 J/g	High energy storage capacity, prolongs distillation after sunset.

PCM

Weather conditions suitability

At midday, sunlight **reached about 800 W/m^2 GHI**, giving strong energy for evaporation. **Temperatures** rose from 12°C in the morning to 22°C in the afternoon, **then cooled to $15\text{--}17^{\circ}\text{C}$** by evening, which helps both evaporation and condensation. Humidity dropped from 34% to 20%, making evaporation faster. **Winds stayed gentle**, around 3–5 m/s, with a peak of 5.25 m/s at 11 AM.

PSS-Sand and PSS-PCM comparison

The sand system reaches **higher peak** temperatures, while the PCM system moderates temperature **fluctuations** and stores heat for longer periods. This highlights how PCM can stabilize operation and **extend distillate** production into evening hours, whereas sand provides stronger daytime heating

Collected volume and thermal performance

Collected volumes for 1 m²:

- **9.7 for PSS-S**
- **13.9 PSS-PCM**

The PCM system consistently shows **higher collected** water volumes and better thermal efficiency than the sand system. This demonstrates that PCM improves energy storage and utilization, leading to more stable performance and greater freshwater output

Limitations of Solar Stills

- **Low freshwater** production compared with conventional desalination systems.
- Performance depends strongly on **solar radiation** and **weather conditions**.
- Water production **decreases** significantly **after sunset**.
- Heat **losses** reduce the overall efficiency of the system.
- **Large land area** is required to produce high volumes of freshwater.

Example of future work

- ❑ Solar still for: drip irrigation in remote region.
- ❑ Multiple unit to produce 200 L for 10 Ha
- ❑ With AI integration for management
- ❑ Can be mobile system.

Thank you
